**Aantal vragen:** 18

1

6 pt.

Which abstract syntax is the best fit for the following grammar:

$V \rightarrow Va \mid bV \mid V[V] = V$

- a. `data V a b = SingleA a | SingleB b | Assign (V a b) (V a b) (V ab)`
- b. `data V = Av V | Bv V | Assign V V V`
- c. `data T = SingleA Char | SingleB Char | Assign String String String`
- d. `data V = V ((Maybe V), (Maybe V), [V,V,V])`

2

Given is the following Haskell datatype:

`data NonEmpty a = NonEmpty a (List a)`

`data List a = Empty | Cons a (List a)`

9 pt.

- a. We define a combined algebra for *NonEmpty* and *List* as follows

`type NonEmptyListAlgebra a n l = (... , ..., ...)`

What is the type of the component corresponding to the constructor *NonEmpty*?

9 pt.

- b. The fold function for *NonEmpty* has the following template:

`foldNonEmpty (nonempty, empty, cons) = f where`

`f (NonEmpty x l) = ...`

`g Empty = ...`

`g (Cons x l) = ...`

What code should be written for the *NonEmpty* case?

8 pt.

- c. We want to use the function *foldNonEmpty* to count the number of *Cons*'s in a *NonEmpty a*. The following template is given

`countCons ne = foldNonEmpty (\x y -> y, const 0, ...)`

What should be written on the dots?

Give your answer as a single line of simple code.

3

6 pt.

A grammar has the following productions:

$S \rightarrow aSb \mid Sa \mid \varepsilon$

We need one more production to be able to derive the sentence *aabbaabb*. Which of the following productions should we add?

- a.  $S \rightarrow aSbb$
- b.  $S \rightarrow bbSaa$
- c.  $S \rightarrow SS$
- d. All the other answers are correct.

4

4 pt.

Is the following statement **false**, **true** or plain **nonsense** (nonsense means that you can't even decide that it is true or false, it is as it were type incorrect)?

If  $A \rightarrow bC$  is a production of a context-free grammar  $G$ , then  $AXY \Rightarrow^* bCXY$

- a. Nonsense
- b. False
- c. True

5

4 pt.

Is the following statement **false**, **true** or plain **nonsense** (nonsense means that you can't even decide that it is true or false, it is as it were type incorrect)?

If  $AX \rightarrow bC$  is a production of a context-free grammar  $G$ , then  $XA \Rightarrow^* XbC$

- a. True
- b. False
- c. Nonsense

**6** Is the following statement **false**, **true** or plain **nonsense** (nonsense means that you can't even decide that it is true or false, it is as if it were type incorrect)?  
4 pt.

If  $A \rightarrow bCX$  is the only production with  $A$  as a left hand side in a context-free grammar  $G$ , then it can never be the case that  $A \Rightarrow^* bC$

- a. True
- b. False
- c. Nonsense

**7** Is the following statement **false**, **true** or plain **nonsense** (nonsense means that you can't even decide that it is true or false, it is as if it were type incorrect)?  
4 pt.

A context-free grammar that employs a finite alphabet can describe a language with infinitely long sentences.

- a. True
- b. False
- c. Nonsense

**8** Is the following statement **false**, **true** or plain **nonsense** (nonsense means that you can't even decide that it is true or false, it is as if it were type incorrect)?  
4 pt.

A context-free grammar that employs a finite alphabet can describe a language with infinitely many sentences.

- a. True
- b. False
- c. Nonsense

- 9** Assume that the function *abs* computes the absolute value of an integer.  
6 pt.

Which of the following grammars generates the language

$$\{a^k b^n c^m \mid k = \text{abs}(n - m), k, n, m \geq 0\}$$

- a.**  $S \rightarrow U \mid T$   
 $U \rightarrow aUb \mid bUc \mid \varepsilon$   
 $T \rightarrow bTc \mid aTc \mid \varepsilon$
- b.**  $S \rightarrow TU$   
 $T \rightarrow A \mid B$   
 $A \rightarrow aAb \mid \varepsilon$   
 $B \rightarrow bBc \mid \varepsilon$   
 $U \rightarrow V \mid W$   
 $W \rightarrow aWc \mid \varepsilon$   
 $V \rightarrow bVc \mid \varepsilon$
- c.**  $S \rightarrow aSc \mid T$   
 $T \rightarrow bTc \mid \varepsilon$
- d.**  $S \rightarrow T \mid U$   
 $T \rightarrow AB$   
 $A \rightarrow aAb \mid \varepsilon$   
 $B \rightarrow bBc \mid \varepsilon$   
 $U \rightarrow aUc \mid V$   
 $V \rightarrow bVc \mid \varepsilon$

**10**

6 pt.

What is the language generated by the following grammar:

$S \rightarrow AB$

$A \rightarrow aAb \mid ab$

$B \rightarrow bbBa \mid bba$

a.  $\{vwx \mid v, w \in a^n, x \in b^{3n}, n \geq 1\}$

b.  $\{a^n b^{3n} a^n \mid n \geq 1\}$

c.  $\{a^n b^n b^{2m} a^m \mid n, m \geq 1\}$

d. All other answers are wrong.

**11**

1 pt.

Given is the following grammar:

$$X \rightarrow X T T X \mid S$$
$$S \rightarrow ab \mid cd$$
$$T \rightarrow \text{Nat}$$

X is the start symbol. Which of the following grammars is not left recursive, but equivalent?

**a.**

$$X \rightarrow X (T T S)^*$$
$$S \rightarrow ab \mid cd$$
$$T \rightarrow \text{Nat}$$

**b.**

$$X \rightarrow S \mid S Z$$
$$Z \rightarrow T T X \mid T T X Z$$
$$S \rightarrow ab \mid cd$$
$$T \rightarrow \text{Nat}$$

**c.**

$$X \rightarrow Z T T X \mid S$$
$$Z \rightarrow X \mid \varepsilon$$
$$S \rightarrow ab \mid cd$$
$$T \rightarrow \text{Nat}$$

**d.**

$$X \rightarrow S T T Z$$
$$Z \rightarrow S \mid X$$
$$S \rightarrow ab \mid cd$$
$$T \rightarrow \text{Nat}$$

12  
1 pt.

Consider the following parser:

$pX :: \text{Parser Token Int}$   
 $pX = pY \<*> \text{plnt}$

The parser  $\text{plnt}$  parses a single token to an integer. It has the type  $\text{Parser Token Int}$ .

Consider the parser  $pY$  used by  $pX$  above. What would be the type of the result obtained by applying  $pY$  to a list of tokens? In other words, what is the type of:

$\text{runParser } pY \text{ input}$

where  $\text{input}$  is a list of tokens?

- a.  $\text{Int} \rightarrow \text{Int}$
- b.  $(\text{Int} \rightarrow \text{Int}, [ [\text{Token}] ] )$
- c.  $[ (\text{Int}, [\text{Token}]) ]$
- d.  $[ (\text{Int} \rightarrow \text{Int}, [\text{Token}]) ]$

13  
1 pt.

Consider the following parser:

$pZ :: \text{Parser Token Int}$   
 $pZ = f \<\$> \text{plnt} \<*> \text{many plnt}$

The parser  $\text{plnt}$  parses a single token to an integer. It has the type  $\text{Parser Token Int}$ .

What is the type of  $f$  ?

- a.  $\text{Parser Token } ( \text{Int} \rightarrow [\text{Int}] \rightarrow \text{Int} )$
- b.  $\text{Parser Token } [\text{Int}]$
- c.  $\text{Int} \rightarrow \text{Int}$
- d.  $\text{Int} \rightarrow [\text{Int}] \rightarrow \text{Int}$

14  
1 pt.

What follows are several properties involving parser combinators. Which of these properties is **NOT** *true*?

- a.  $\text{many } (\text{some } p) \equiv \text{some } (\text{many } p)$
- b.  $(:) \<\$> p \<*> \text{many } p \equiv \text{some } p$
- c.  $\text{satisfy } (== c) \equiv \text{symbol } c$
- d.  $\text{greedy1 } (\text{greedy1 } p) \equiv (\backslash x \rightarrow [x]) \<\$> \text{greedy1 } p$

**15**

6 pt.

Given that  $L, L_1, L_2$  are languages over the same alphabet  $\Sigma$ , Which of the following statements is false?

- a.  $L^* \cup L = L^+$
- b.  $(L^R)^* = (L^*)^R$
- c.  $(LL^*)^+ = L^+$
- d.  $(L_1L_2)^R = L_2^R L_1^R$

**16**

5 pt.

Write a short RegExp that matches all the 'good' email addresses below, and matches none of the 'bad' addresses below.

Note that you only need to consider these examples, not anything else you may know about email addresses!

0 points: tests fail

2 points: tests pass

4 points: tests pass & regexp fits in an SMS (i.e.  $\leq 140$  characters)

6 points: tests pass & regexp fits in a terminal line (i.e.  $\leq 80$  characters)

8 points: tests pass & regexp fits in an email subject line (i.e.  $\leq 48$  characters)

10 points: tests pass & regexp fits in a linux username (i.e.  $\leq 32$  characters)

**Good examples:**

17 This question is about one NFA $\epsilon$ :

and several DFAs:

d

All of these automata work with the alphabet  $\{1\}$ .

3 pt.

**a.** Which of these DFAs represent the same language as the NFA $\epsilon$ ? Check all that apply.

- a.** a
- b.** b
- c.** c
- d.** d

1 pt.

**b.** Which of these DFAs is the result of the subset construction on the NFA?

- a.** a
- b.** b
- c.** c
- d.** d

18 This question is about the following Regular Expression:

2 pt.

$(a^+b|c^+)^*$

And the following four diagrams:

Which of these are valid NFAs that represent the regular expression? Check all that apply.

- a. a
- b. b
- c. c
- d. d
